

M102410 WASTE HOPPER

Description:

During the slaughter of the cattle, different waste is eliminated, especially in the transfer platform, but also in other points of the process.

At this point the hind legs, udders, sex of the males, etc. are usually removed.

For proper accumulation in cutter trolley or containers at ground level or on lower floors, tube-shaped pipes are usually required anchored in the platform at the height of the operators' work and with discharge at 900 from the ground or in a lower floor of the slaughterhouse.

The dimension and diameter are usually adjusted to each installation, although they all have similar technical characteristics.

Technical Data:

- Manufactured using 2 mm thick stainless steel sheet curved or rolled with a diameter of 300 mm and a length of 2000 mm
- Tig welded and galvanized finish.
- Funnel placed in the mouth of the slide for the best collection of the product. At the base it incorporates a flange for better support
