

## PNEUMATIC ACCUMULATOR FOR LAMB CARCASSES

### Description

The carcass accumulator for lambs is an equipment that facilitates the work of labeling and transferring in the accumulation of carcasses of more than 10 kg.

The equipment hangs down from the upper structure, allowing its longitudinal mobility thanks to an upper track that allows it. The robot lowers and raises the weight of the carcass thanks to a pneumatic cylinder with the appropriate section and stroke.

### Technical Data:

- Body by pneumatic cylinder  $\Phi$  80
- It is lowered from the structure by a double track and aluminum double track trolley
- AISI -304 stainless steel support spike
- Stainless steel handle with knobs embedded in this
- The operating buttons are at 24 volts
- Pneumatic valves with closed centers
- Pneumatic control unit for flow regulation, lubrication and drying
- Incorporates electropneumatic control panel
